PRODUCT INTRODUCTION

Mizole Cream is an antifungal medicine used to treat fungal infections of the skin. It works by killing the fungus that causes infections such as athlete's foot, jock itch, thrush, ringworm, and dry, flaky skin.

Mizole Cream should be used in the dose and duration as prescribed by your doctor. This medicine should be used regularly to get the most benefit from it. Do not use more than you needed, it will not clear your condition faster and may only increase the side effects. Skin infections will usually get better after 2 to 6 weeks. Do not use the medicine for longer than your doctor has told you to and let him or her know if your condition does not improve after 2 to 6 weeks of treatment. The effects of the medicine can be increased by keeping the affected area clean and dry, and washing hands before and after treating the infection. If you have an athlete's foot, wash your socks or tights thoroughly and change your shoes daily if possible.

The most common side effects of using this medicine include burning sensation, irritation, itching, and redness at the site of application. It may also cause dryness, peeling, or blistering of the skin. These are not usually serious, but you should call your doctor if you think you might have a severe allergic reaction. Signs of this include rash, swelling of the lips, throat, or face, swallowing or breathing problems, feeling dizzy or faint, and nausea. Get emergency help if this happens. Avoid direct contact with your eyes. In case of direct contact, wash your eyes with water and seek immediate medical attention.

It is not likely that other medicines you take by mouth or injection will affect the way this medicine works, but talk to your doctor before using it if you have recently used another medicine that contains a steroid or had an allergic reaction to another antifungal medicine. This medicine should only be used if it is clearly needed if you are pregnant or breastfeeding. Ask your doctor if it is safe.
